

ABSTRACT

The invention relates to a moisture cross-linkable composition usable as an adhesive or sealant which is very easy to use and exhibits excellent bonding performance.

5

The composition is obtained by mixing 100 parts by weight of an organic polymer (A) with moisture cross-linkable reactive silane terminal functions and 1 to 70 parts by weight of an organic polymer (B) miscible at ambient temperature with polymer (A), selected from among polyesters, polyethers, polyurethanes, polyacrylates,
10 polyethylenediimines, polycarbonates, polyureas or polyamides.
